

# A water quality model for Lake Rotokakahi

# Lake Rotokakahi

Lake Rotokakahi sampling locations. A = central-lake station, B = small spring-fed inflow, C = Lake Outlet (Te Wairoa Stream). 2011 aerial photography.

# Lake Rotokakahi

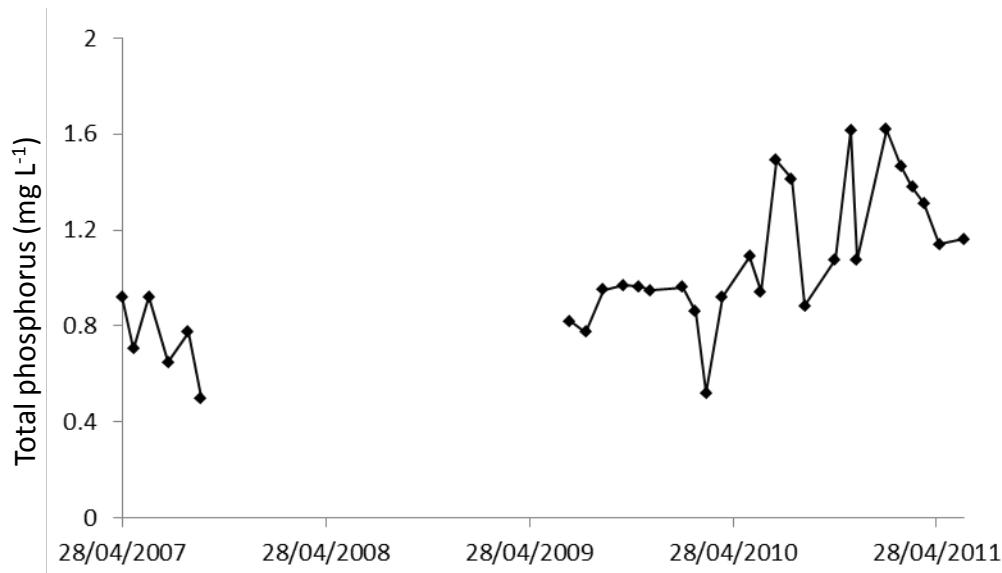

Trophic Level Index values for Lake Rotokakahi  
and Lake Outlet from 1990 to 2011  
(Butterworth, 2012).

# Water quality model objectives

- Reproduce the recent decline in water quality
- Determine the main drivers for decline in water quality
- Simulate nutrient reduction scenarios for improving water quality and/or re-establish Kakahi population

# Model input

- Reasonably good inflow data available for the period 2009-2011, eg. Below

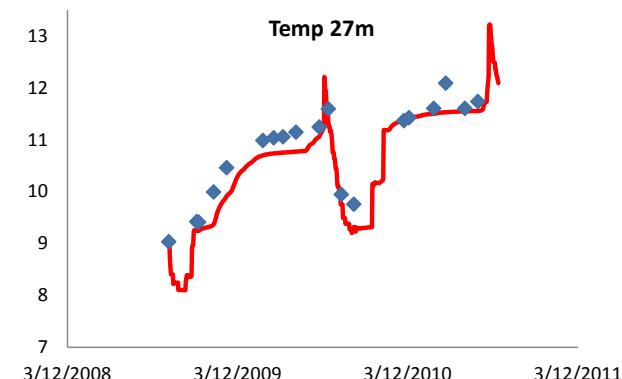

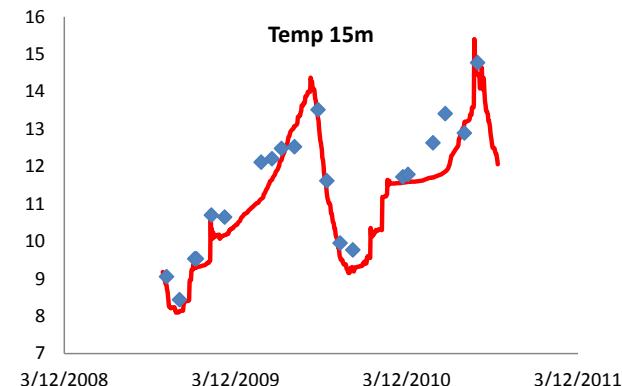

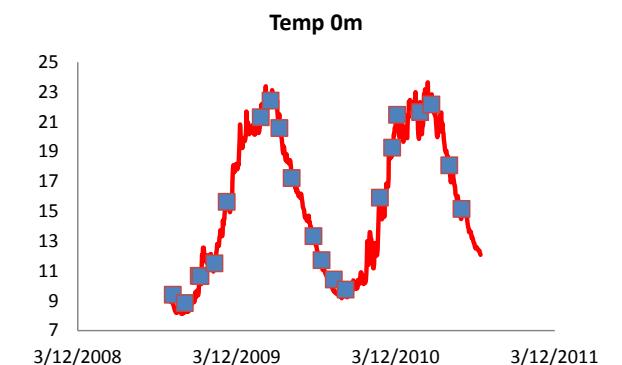

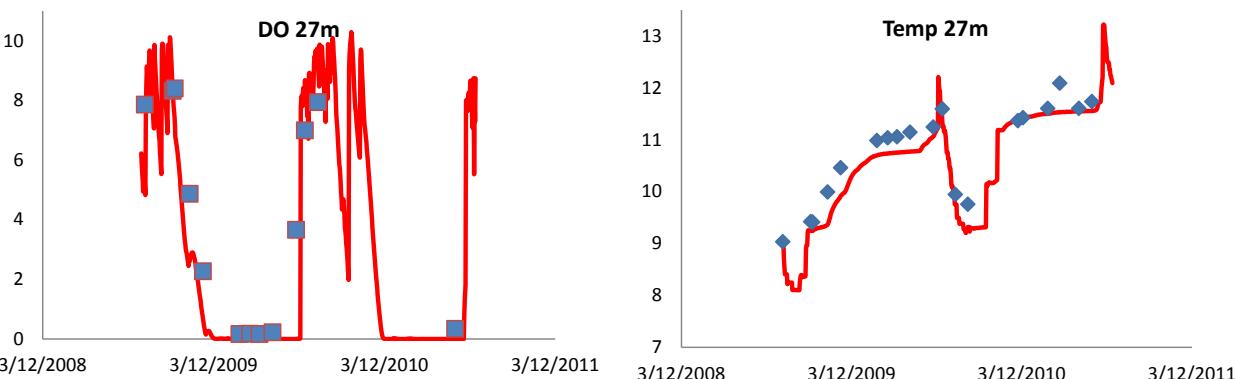

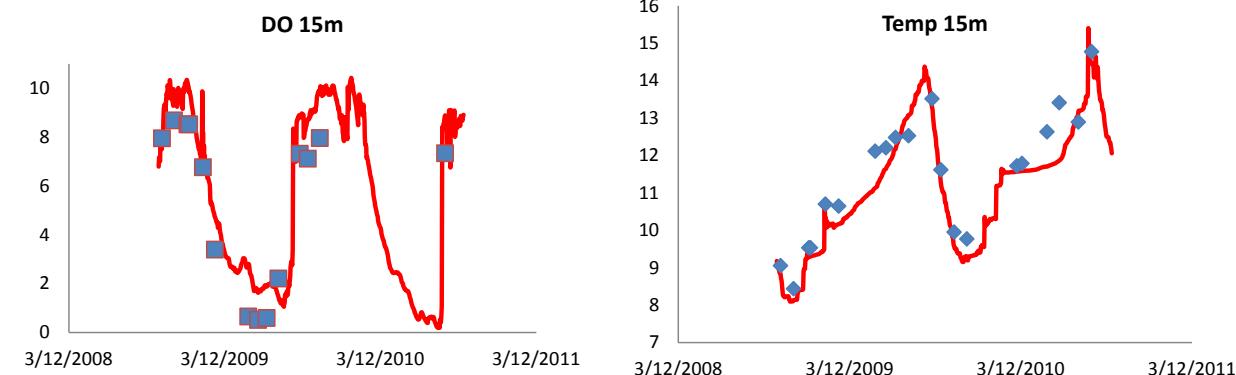

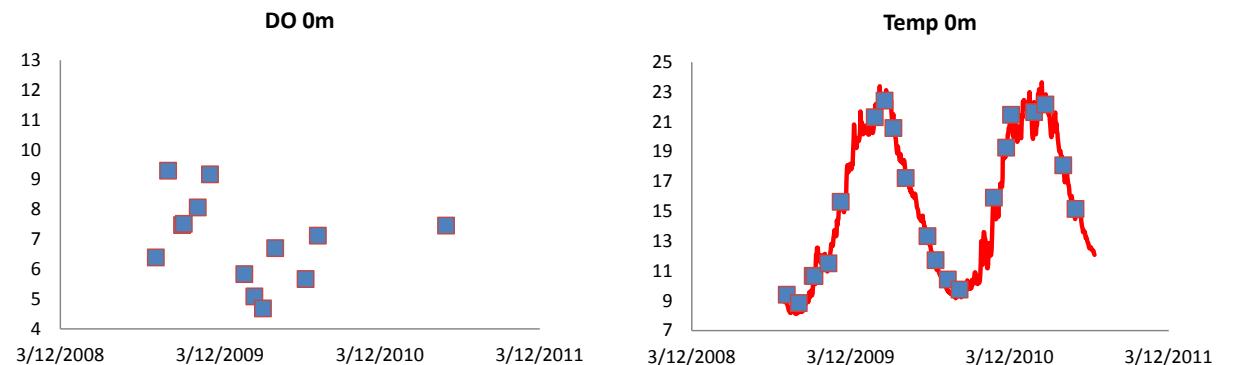

- In the absence of more sophisticated hydrological input data, model period limited to 2009-2011

# Nutrient budget

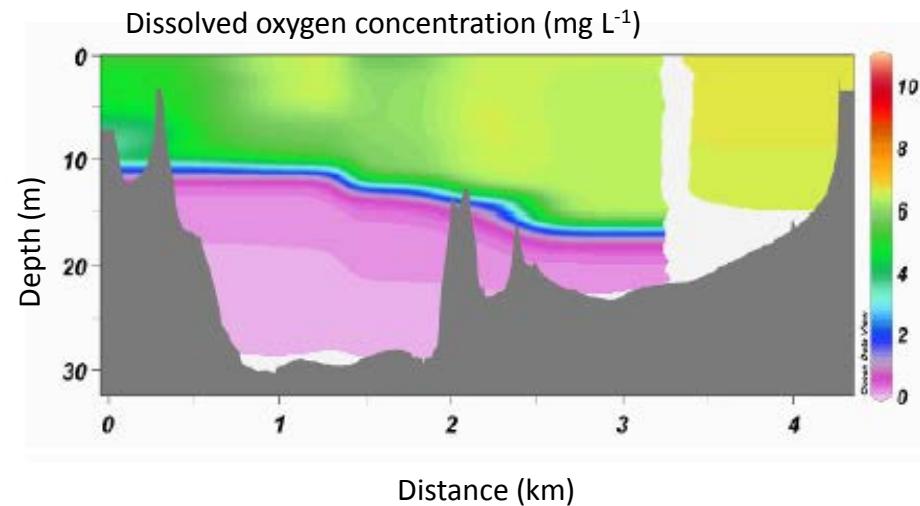

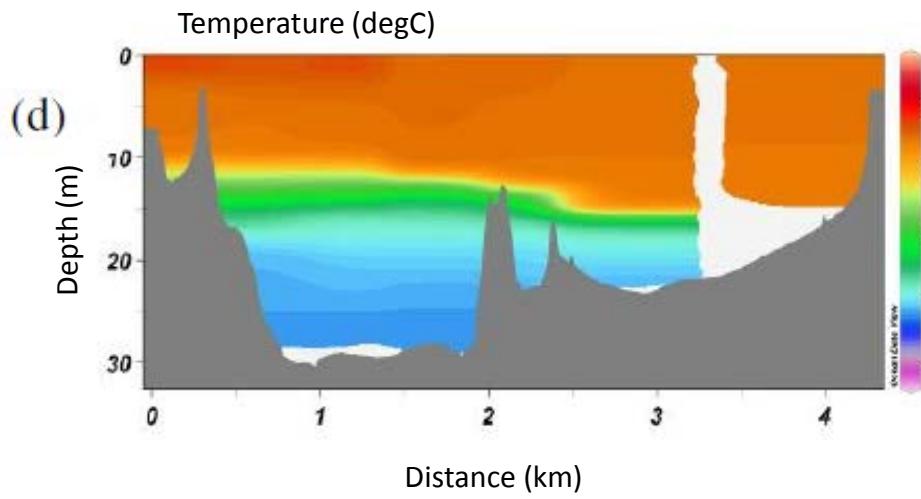

Nutrient load calculations	Year	TN load (t/yr)	TP load (t/yr)	Water inflow (m <sup>3</sup> /yr)
Surface inflow	2008	6,427	0,508	320075
	2009	5,564	0,440	239918
	2010	6,264	0,495	307664
Groundwater inflow	2008	0,522	0,208	8968121
	2009	0,496	0,203	7658220
	2010	0,795	0,352	8751996
Rainfall	2008	1,182	0,087	6484337
	2009	0,934	0,069	5126087
	2010	1,138	0,084	6245255
Emphemeral inflow	2008	0,839	0,333	515246
	2009	0,642	0,263	309390
	2010	1,368	0,605	546217
SUM	2008	7,788	1,048	
	2009	6,703	0,906	
	2010	8,426	1,453	
Average		<b>7,639</b>	<b>1,136</b>	

# Calibration of 1D model

# Spatially resolved data

Spatial variability in Lake Rotokakahi may influence our ability to use a 1D model

# Where to from here

- 3D model setup in progress
- Increasing conceptual complexity to include Kakahi
- Possibly use of remote sensing to identify logging scheme in the catchment (useful for model scenario development)
